ABSTRACT

In recent years, mobile robots have been attracting increasing attention from scientists and factories. With breakthrough techniques in the non-contacting proximity sensors, these sensors enable reliable mobile robot for position or object detection base on the distance between sensor and object. In fact, there are some factors to determine the static parameters of the sensor for example sensing distance, a dimension of the material, a thickness of a material and so on. However, it is necessary to measure at a static state of the inductive proximity sensor since the detective and navigation systems perform more accurately by analyzing the information signal. Therefore, the first hand-made measurement system is used to verify the relationship between the output sensor signal and the position of the sensor in the static performance with the aluminium object. The measured data have also illustrated the output signal of proximity sensor in the model and theory which is not identical. In addition, some information about the different effects of the position sensor and optimum operating range of a mobile robot is summated from the results. Moreover, most of the technology uses simple HF-oscillation principle as an inductive proximity sensor with a decrease in the quality of the oscillator circuit's electromagnetic to find the tape. By applying this technique, the external factors may cause negative effects to the system performance. To overcome this situation, another hand measurement with the objects will be put the following arrangement: the main tape- the obstruction sheet- the disturbing tape. After measuring, data results are used to analyze the influence of the obstruction sheet thickness and disturbance tape to the noise in received signals. By comparing the results achieved, giving solutions to enhance the static performance of the proximity sensor for a mobile robot, such as: choosing of material thickness ranges which is suitable for the operation of a mobile robot, setting the proper sensing distance to be the most stable. The research can also be used to lead the mobile robot based on inductive proximity sensor that becomes more robust against noises and disturbances.

Keywords: Static performance, sensor identification, sensor range, the disturbance, inductive proximity sensor, mobile robot, obstruction sheet.

ACKNOWLEDGEMENT

Foremost, I would like to express my deepest gratitude to my advisor Prof. Tsing-Tshih Tsung. I would never have been able to finish my dissertation without the guidance of my professor for the continuous support of my Master study and research. His guidance provided me some experiences in the research which helped me in all the time of doing research and writing of this thesis.

My sincere thanks also go to Graduate Institute Digital Mechatronic Technology- Chinese Culture University. Based on the theoretical foundations of Graduate Institute Digital Mechatronic Technology, my thesis built more reliable. Besides my advisor, I would like to thank Prof. Jeng-Tze Huang who is the Dean of the Graduate Institute Digital Mechatronic Technology. With his love, kindness and support has shown during the past one year of half, it has taken me to finalize this thesis.

I would also like to thank to the assistant of the Graduate Institute of Digital Mechatronic Technology- Chinese Culture University- Mrs. Shiu Wei-Jen. She always provided me with the useful information in the procedures of the university and on diverse exciting projects of my department.

In addition, a thank you to my classmates and laboratory mates for their assistances and encouragements. With their help, it is easy for a foreign student like me to do anything better than expected.

Last but not least, I would like to thank my family for their love, supports and sacrifices. Words cannot express how grateful I am to my family for all of the sacrifices that you've made on my behalf. Their encouragements are motivation for me to finish this thesis.

Tang Thi Khanh Vy

CHAPTER 1 INTRODUCTION	1
1.1. Research Background and Motivation.....	1
1.2. Research Object	6
1.3. The structure of this study	9
1.4. Significance of the Study.....	10
CHAPTER 2 LITERATURE REVIEW	12
2.1. History development of Proximity Sensor	12
2.2. Inductive Proximity Sensor	14
2.2.1. Types of sensors	14
2.2.2. The principles of inductive proximity sensor operation.....	18
2.2.3. Principle of high-frequency oscillation type inductive proximity sensor	18
2.2.3. The characteristics of inductive proximity sensor SIEA-M12	19
2.3. Technical definitions of inductive proximity sensor	21
2.3.1. Operating distance	21
2.3.2. Hysteresis	22
2.3.3. Target Correction factors.....	23
2.3.4. Switching frequency	25
2.3.5. Response time.....	26
2.3.6. Ripple	27
2.3.7. The definitions of other elements	27

2.4. Application of Inductive Proximity Sensor	28
2.4.1. Features.....	28
2.4.2. Application of Inductive Proximity Sensor:.....	30
CHAPTER 3 MEASUREMENT METHOD AND SETUP.....	32
3.1 Methodology.....	32
3.2 The composite of materials.....	33
3.3 The research method of the output signal shape.....	34
3.3.1 Diagram of the output signal shape experiment	34
3.3.2 Measurement proccesing of the output signal shape experiment.....	36
3.4 The research method of the disturbance effect	37
3.4.1 Diagram of the disturbance effect experiment	37
3.4.2 Measurement proccesing of the disturbance effect experiment	39
CHAPTER 4 RESULT AND DISCUSSION	43
4.1. The output signal shape experiment:	43
4.2. The disturbance effect experiment.....	48
4.3. Comparison the disturbance ability of materials	52
4.4. The survey of the plastic thickness	53
CHAPTER 5 CONCLUSION AND FUTURE WORK.....	55
5.1. Conclusion	55
5.2. Future work.....	57
